

Secure Corporate Data Storage For Every Company

FILINGBOX SMB

What is FilingBox SMB?

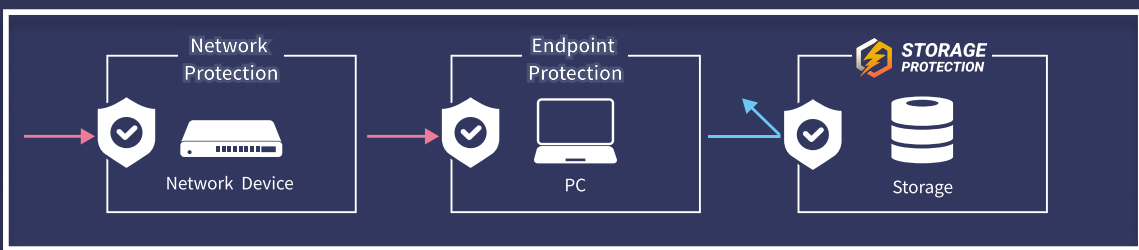

FilingBox SMB is a secure corporate data storage for small and medium size companies. It solves every issue related to data management at once, from archiving and sharing to access security and malware prevention of data in a corporate environment. It has an application detection module and a file-vs-user security module and provides a network drive for PCs. It examines applications requesting data and a file-vs-user security level together. By default, it provides a file with a read-only attribute for all applications except Windows Explorer in preventing ransomware attacks. When a user sets the security level to a file, then it provides a fake file to all applications except for Windows Explorer operated by a user with a higher security level. It prevents data breach malware attacks. It is good for external malware prevention and internal data access security.

The US and International Patent Pending and Registered

What is the Storage Protection Technology?

Storage protection technology protects data in a network drive against ransomware and data breach malware attacks. As network protection and endpoint protection technology have a detection module on the network and endpoint device, we added a detection module to the storage, which allows only preregistered applications, i.e. Windows Explorer, and a user with a higher security level to read, modify, and delete data. It works well together with existing network protection and endpoint protection technologies. The emphasis is on the importance of adding one more protection layer to the storage, like network protection and endpoint protection technology.
